Breakwater built from Nova Scotia rocks supported healthy corals up until a year ago, then SCTLD (Stony Coral Tissue Loss Disease) hit...Documenting its arrival on Vauxhall Reef was my "project" in 2023 http://versicolor.ca/.../stony-coral-tissue-loss-in-... Scientifically interesting but not uplifting! A glimmer of hope- in the bottom pic there are 2 corals that seem unaffected by the disease.

This was devastating. Top pic shows healthy coral on April 3 in 2023 (Not Apr 24 as in pic, that's an error), bottom same corals on Jan 12, 2024 completely dead and grown over by algae etc. What killed the *A. prolifera* coral? (it was not affected by SCTLD). So I guess answering that question or at least documenting the changes is my project for 2024

So Many Thanks to Sandy Crest Medical Centre, Friends, & of course Nina for helping me get through a bout of dengue, several of those friends themselves afflicted.

It was only my 3rd day in the water since arriving, I had been very saddened to see on two earlier days (Jan 12, 15) the effects of extreme coral bleaching in 2023; today (Jan 31) I was looking for some elkhorn coral on the reef by 'The Club', fully expected it to be completely dead; I couldn't find it. It was... [See more](#)

Good and Not-So-Good News from the Reef Flat (not covered on CBC or CNN!). The Reef flat is that area of shallow, barren-looking rocks extending out 50+ meters from shore, generally not good for snorkelling because it is shallow and waves break over it, but its one of my favourite place to explore. It's been hard to post anything this year because most of the news from underwater is bad, but life goes on as they say... so I will try to present a bit of good news with each ... [See more](#)

So here is the Bad News. A & B are colonies of *Acropora prolifera*, the Fused Staghorn Coral. It is a hybrid between 2 species I "discovered" on the Vauxhall reef (at Beachlands) in 2015, and have been following every year since as it grows and spreads. These 2 specimens (A & B) were fully healthy on Mar 30, 2023 BUT not on Jan 15, 2024....in 2023 there were record warm temperatures and several "coral bleaching events"... and one or more of those apparently killed all of these... The Knobby Brain Coral, at right. It has wonderful curves and different colours and shades and is prominent in these shallow waters, at least at Beachlands/Vauxhall, the healthiest fringing reef in the MPA (marine Protected Area). I am so happy to see it unscathed by the heat, probably because it has been an occupant of that habitat for a very long time, and there are often extremes of temperature associated with very low tides etc. The Fused Staghorn Coral was a newcomer (probably circa 2005). To the left is a colony of Stinging Coral -to my surprise it did NOT survive the warming events unscathed...(more on that later) [See less](#)

Seen today: one of the biggest parrotfish I have seen on Vauxhall Reef (off if Beachlands) , ~ 2.5 -3ft ft long. Photo from a distance, 'hard to get close to. I think it is a Queen Parrotsfish "Super Male" . "At an average length of 25 cm (10 in), females change sex to become males. The larger males move on to a new color phase, becoming pale bluish-green, with blue spots near the mouth, yellowish streaks between the mouth and eye, and pale blue bars on the pectoral fins."

Fish of the Day (Mar 3) I like to snorkel just seaward of waves breaking in the Reef Crest zone (the shallowest part of the reef) of the reef just north of 'The Club', late in the day when fish are feeding on debris stirred up by the waves and on the fish feeding on the debris. Today lots of these 'long fish' moved in, 3-5 ft long. As well as I can figure, they are "Bluespotted Cornet Fish". [See less](#)

They move quickly and it's hard to get close to them, so this is the best pic so far.

"The bluespotted cornetfish is usually a solitary predator, stalking and feeding on small fishes, crustaceans, and squid. Sometimes, they feed in small groups along the bottom on small, bottom-dwelling fish which their long snouts are very efficient at sucking up." Wikipedia [See less](#)

MY fish of the day, a pair in the lower center of photo, Spotfin Butterfly Fish. 'tricky to see. (Next Photo is a close-up), It's a new one for me. Banded Butterfly fish and Four-eye Butterfly fish are relatively common on Vauxhall reef. Butterfly fish almost always seen in pairs. The habitat is the seaward end of a "spur" in the "spur and grooves" characteristic of the Seaward Slope zone of the Reef, floor circa 6 m depth. It's the most actively growing part of the reef and at Vauxhall; this one has circa 90% living coral cover. It's like a reef 'should be'; one exception the yellow brain coral was probably a victim of coral bleaching in the fall of 2023, some stinging coral likewise affected here, but overall still looking good. Spotfin Butterfly Fish. The "Spot" is apparently the key distinctive feature. It's the small black mark at edge of dorsal fin. Bfly fish feed on coral polyps. "Generally diurnal and frequenting waters less than 18 m (59 ft) deep (though some species descend to 180 m (590 ft), butterflyfish stick to particular home ranges. These corallivores are especially territorial, forming pairs and staking claim to a specific coral head." - Wikipedia. [See less](#)
